THE WRONG SECURITY SYSTEM
CAN LEAVE YOU WITH
A LOT OF HOLES TO FILL

ITI WIRELESS SECURITY SYSTEMS BORED HOLES BARRED

PROTECTION

IS THE MAIN PURPOSE OF ANY

SECURITY SYSTEM; HARDWIRE

OR "WIRELESS."

take days and great effort to install. Wires that have as much in common with today's technology as the telegraph.

— Don't be tied up by old hardwire technology. Choose instead an ITI wireless security system for your home or business. They're more than just a burglar alarm. They monitor every door, window and other entryways for unwanted intrusions; detect fire and smoke; and even track temperature and lighting—all without miles of wire rammed through your walls. — ITI's wireless systems employ today's most advanced technology. They're reliable, convenient to operate, easily upgraded and expanded and can even move with you to a new location. — Plus, wireless security systems are much easier to install. Instead of a few days and countless holes in your walls, wireless systems are neatly installed in just a few hours, saving you labor costs as well as annoying disruption.

A PEACEFUL,
EASY FEELING.

If the threat of mastering a new technology leaves you with sweaty palms, reassurance is at your fingertips.

ITI wireless security systems are as easy to operate as a touchtone telephone. In fact, with some ITI systems you can use any touchtone phone—including your cellular phone—to operate your system and get voice status reports reassuring you that your property is being protected. Simply phone in, enter your access code, arm or disarm the system, turn on

Hardwire security systems, as the name suggests, are operated by wires. Wires that are rammed through countless holes drilled into your walls, floors, ceilings and an occasional pipe or two. Wires that can

a light in an upstairs room or garage and hear that everything is OK—right down to the room temperature.

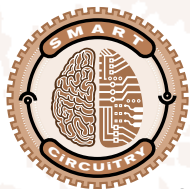

ITI's wireless systems can be controlled by a simple-to-use touchpad on your wall, a handheld touchpad you can use anywhere, or even a keychain touchpad you can carry with you in your pocket or purse.

WIRELESS

ADVANTAGES ARE INVISIBLE,
BUT NOT HARD TO SEE.

ITI's patented Learn Mode sensors can monitor every critical aspect of your home or business. Each sensor has its own factory-programmed identity. The ITI security system control panel "learns" the identity of each sensor in the system. This eliminates the chance of programming errors in the field and cross-talk with another system or wireless devices such as cellular phones and garage door openers.

ITI systems use a special crystal-controlled radio technology. They are not subject to the effects of temperature or humidity, thereby enhancing the system's reliability and performance. The radio receivers use a dual antenna system called spatial diversity. This allows the system to receive radio signals

from multiple sensors even when the sensors are activated simultaneously. Look for crystal-control and spatial diversity in any good wireless system.

In addition, ITI systems are supervised. Supervised means the system's sensors regularly report their status into the control panel. This assures you that the system is operating properly and that the sensor batteries are in good condition. In fact, ITI has spent considerable engineering effort to minimize the power needed to operate the sensors, giving the sensors a typical five to eight year battery life—the best in the business. A door/window sensor with an expected battery life of 20 years is also available.

What's more, expanding an ITI wireless system is quick and easy. As your security needs evolve, additional sensors can be installed in minutes and with minimal disruption.

ITI WIRELESS

IS SMARTER.

Make no mistake. Along with convenience and reliability, ITI wireless systems are technologically superior to hardwire products as well as other wireless systems on the market. In fact, ITI was founded with the specific goal of perfecting and commercializing supervised wireless security systems.

Since 1983, ITI has built a formidable base of technology and an unparalleled level of

expertise, becoming the largest manufacturer of supervised wireless security systems—and a leading innovator in the security marketplace.

So, if you're considering installing a security system in your home or business, first think wireless. Then think ITI.
